PROFESSIONAL SUMMARY

Product engineer with ~4 years shipping production software at Adobe and Samsung, focused on applied AI. Built and deployed an LLM agent used by the Adobe team on live incidents (tool calling over logs, metrics and system state; RAG with citations and evaluation), and owned a four-service platform syncing data for 6.5M+ users. Currently building an early-stage AI product that automates a complex business process, doing customer discovery directly with users. Takes end-to-end ownership from concept to deployment across backend, AI and front end.

TECHNICAL SKILLS

AI & LLMs: Large Language Models (LLMs), Agentic AI, AI Agents, Tool Calling, Retrieval-Augmented Generation (RAG), Vector Search, Hybrid Retrieval, Reranking, Structured Output, LLM Evaluation; agentic coding (Claude Code, Cursor)
Full-Stack: Java 17/21, Spring Boot, React, Next.js, Tailwind CSS, JavaScript, REST APIs, Microservices, Spring Security
Data & Infrastructure: PostgreSQL, Aurora, Redis, MongoDB, MySQL, Apache Kafka, Amazon Web Services (AWS: ECS, S3), Docker, Kubernetes, CI/CD (GitHub Actions)
Reliability & Quality: Monitoring & Alerting (Splunk, Grafana), Resilience4j, Idempotency, JUnit 5, Mockito, Code Reviews

WORK EXPERIENCE

Adobe | Member of Technical Staff 2 Jun 2024 – May 2026

- **Owned an end-to-end production platform:** four Kafka-connected services (Java 17, Spring Boot, PostgreSQL/Aurora, Redis, Kubernetes on AWS) syncing student and teacher data from Clever and ClassLink for 6.5M+ K-12 users at 99.9%+ uptime.
- Built and deployed the **RosterSync Incident Copilot**, an LLM agent the team used on live production incidents (see Projects).
- Drove architecture and upheld engineering standards through code reviews and final sign-off on every production release; explained technical issues and designs to product managers.
- Cut worst-case sync for a 120k+ user district from ~12.5h to ~1h50m (~85%) by profiling first, then adding bounded-parallel processing, parallel batch writes, Aurora read replicas and JVM/GC tuning, with no added infrastructure cost.
- Replaced O(N) per-user API calls with bulk aggregation and Redis-backed builders, cutting downstream calls ~99.99% and eliminating HTTP 429 throttling; built self-healing execution on Kubernetes and owned monitoring (MTTD <15 min).

Samsung | Software Development Engineer Jul 2022 – May 2024

- Maintained and improved the catalogue and checkout platform of **samsung.com/in** (Java, Spring Boot, PostgreSQL, Kafka, Redis), handling millions of daily requests with order volumes scaling 10x during launches and sales.
- Shipped customer-facing React storefront features and API integrations alongside backend work; reduced REST API latency 15-25% via query-plan analysis, indexing, N+1 elimination and Redis caching.
- Cleared Samsung's internal Professional Test (low-level design), then mentored ~10 engineers in design and architecture.

Oracle | Software Development Intern Jan 2022 – Jun 2022

- Built Spring Boot REST APIs and React front-end components for internal apps end to end; optimised MySQL queries to cut a reporting dashboard from 200 ms to 50 ms.

PROJECTS

RosterSync Incident Copilot | AI Agent, RAG | Spring Boot, LLM APIs Adobe, in production

- An LLM agent that decides which tools to call to pull live sync state, logs and metrics, then combines that evidence with retrieved runbooks and past incidents (embeddings, hybrid semantic + keyword search, reranking) into cited diagnoses.
- Built evaluation and guardrails for retrieval recall, groundedness, citation precision and latency, with tenant-aware filtering, graceful degradation and explicit separation of evidence from model inference.

Atlas Tender | Early-stage AI start-up, built with a partner 2026 – Present

- Built the backend, AI pipeline and front end of a product that reads tender documents and company papers, automates the eligibility workflow with LLM tool calling and human review, and flags missing documents, fixable gaps and blockers.
- Running customer discovery and pilot outreach directly with contractors.

Zorovah (zorovah.com) | Founder | Spring Boot, React / Next.js, Gemini API, AWS ECS 2025 – 2026

- Took a multi-tenant school SaaS from concept to 2 pilot schools, working with their staff; integrated the Gemini API (structured JSON output, async generation, human review) to auto-generate progress reports, cutting teacher reporting time ~80%.

Confronta (mayank-bhati.github.io/confronta) | Founder | Next.js, React, Tailwind Live

- Launched a career-guidance web app for Italian students: adaptive survey, client-side matching engines, GitHub Actions CI/CD.

EDUCATION

National Institute of Technology, Uttarakhand | B.E. Electrical & Electronics Engineering, CGPA 7.99/10 2018 – 2022
